FOREWORD

This Second Supplement to the Receiving Tube Substitution Guidebook, in addition to the original volume and the First Supplement to it, is an accumulation of over twelve years of experience in substituting tubes in radios, television receivers and other electronic equipment. It is a never-ending process which we shall continue in an effort to keep your information as current as possible.

Most of these additional substitutions are for use in television receivers and therefore, because of their critical application in some cases, special consideration should be given your selection when you have a choice of substitutes. A stage-by-stage discussion of the most popular circuits used in television receivers is included in the First Supplement. If there is any question as to whether or not the stage being substituted is a critical one and which characteristics of the substitute should be given special consideration, take a moment to read the article covering the stage in question.

The information herein, in the large part, calls for substitutions only. It is not the object of these instructions to tell you how to improve radios, television receivers and other electronic equipment but rather to help you use the tubes you have, in order to replace those that are not available. Exceptions to the above statement are tubes especially designed as replacements of types where

improvement is needed generally or for specific use such as 5881 for 6L6, 5AW4 for 5U4G, 6CU6 for 6BQ6GT, and the same type numbers in ruggedized tubes designated by an additional ending letter, as 6SN7WGT. Types such as these are designed to improve the life of the tube, the efficiency of the circuit in which they are applied, or both. Characteristics are generally identical to the type they replace. Elements are heavier duty or especially treated in order to withstand greater overloads and construction is more rugged.

Also included in this supplement is a cumulative index indicating the volume and page where the tube you wish to substitute is located.

We have endeavored to list all the practical substitutions. Some, no doubt, have been omitted. When considering substitution, others not listed will likely come to mind. When this happens, write the tube number down immediately in the form used here and attach it in its proper place.

This supplement includes picture tube substitutions. It is recommended that before substitution of picture tube is attempted, a few moments be taken to read over the short article which precedes the picture tube section.

SUBSTITUTING PICTURE TUBES IN TV RECEIVERS

1. Connecting the External Conductive Tube Coating to Chassis

When a picture tube that does not have an external conductive coating is substituted for one that has the external coating, it is generally necessary to install a metal finger to make contact with the coating in order to connect it to the chassis. Sometimes this finger is attached to the deflection yoke support bracket. Ordinarily a tube that does not have an external coating has a 500- μf capacitor connected from the anode lead to the chassis inside the high-voltage cage. It is normally not necessary to remove this capacitor when substituting a tube that has the external conductive coating.

2. Installing a Capacitor from the Anode Lead to the Chassis

When a tube that does not have the external conductive coating is substituted for one that has the external conductive coating, it is often necessary to install a capacitor from the anode lead to the chassis. In the substitutions listed here we have repeated the same value of 500 μf . Ordinarily this will be satisfactory. In some cases this capacitor will not be necessary. In others best satisfaction may be had with capacitances as high

as 2,000 μf . This is according to individual cases and can be determined by trial. The most convenient location for this capacitor is inside the high-voltage cage.

3. Dimensions

Before attempting any of the substitutions listed here, make sure the substitute tube will fit into the available space. In the magnetic types try to choose a substitute with a neck length similar to the original. Differences in face plate curvatures may make it necessary, in some substitutions listed, to change the mask.

4. Change in Anode Connector

Either the ball-type or cavity-type anode connector is used on picture tubes. Instructions specify when a change is necessary.

5. Replacement or Deletion of Ion Trap

It is necessary to replace the ion trap with the type required by the manufacturer of the substitute tube. Some tubes do not require an ion trap and are being substituted for others requiring either a single or dual ion trap. In these cases,

SUPPLEMENT—RECEIVING TUBE SUBSTITUTION GUIDE

the instruction is "Remove ion trap." Other tubes requiring a single ion trap can be substituted for by installing a dual ion trap and vice versa. In these cases instructions are given. Some manufacturers of picture tubes are using a new type gun requiring a single ion trap in tubes that formerly used a gun requiring a dual ion trap. It is therefore important to check the individual manufacturer's specification on the substitute tube being used.

6. Electrostatic and Self-Focus Tubes

When using electrostatic or self-focus tubes as substitutions for magnetically focused tubes, it is necessary to remove the focus coil from the neck of the tube and replace it with a magnetic centering device. The focus coil may be left in the receiver circuit-wise, in which case it should be mounted in the cabinet in some position where its magnetic field has no effect on the picture. It may be replaced with a choke or resistor. The picture tube socket may have to be changed when it is necessary to bring out a lead from the focus electrode on the picture tube base except in the case of self-focus or automatic focus types. This lead should be connected to a d-c voltage point in the set which gives best focus. The voltage required normally lies between 50 and 350 volts. Self-focus or automatic focus tubes have a special gun structure within the neck of the tube designed

to focus the tube automatically without the use of an external focus voltage.

7. Substituting Electrostatic or Automatic Focus Types with Magnetic Types

When replacing electrostatic focus types with magnetic focus types, discard the magnetic centering device and install a permanent magnet focusing device. This must be mounted on the yoke support with suitable metal brackets. It is practical to replace an electrostatic focus tube using high-focus voltage with a type using low-focus voltage or a self-focus type. When doing this, it is desirable to remove the focus voltage rectifier as a safety measure.

8. Differences in the Face Plate

Differences in the face plate of the tube have little effect on whether or not they may be substituted. Dark-faced tubes give better contrast than white-faced tubes. Some tubes are frosted to decrease reflections and others have an aluminized back for better contrast and brightness. Aluminized tubes in some cases have higher anode voltage applied and this voltage should be reduced in accordance with manufacturers' specifications when other than aluminized tubes are substituted. When substituting aluminized tubes for white- or gray-faced tubes, sufficient voltage is usually available for satisfactory operation.

7HP4-10MP4A

TUBE	SUB.	CHANGES NECESSARY
7HP4	7QP4	Connect 500- $\mu\mu\text{f}$, 20-kv capacitor from anode to chassis. Change anode connector to cavity type. Change ion trap to single.
7NP4	7WP4	Connect external conductive coating to chassis.
7QP4	7HP4	Change anode connector to ball type. Connect external conductive coating to chassis. Change ion trap to double.
7WP4	7NP4	No changes.
8AP4	8AP4A	No changes. Substitute has dark face.
8AP4A	8AP4	No changes. Substitute has white face.
10BP4	10BP4A	No changes. Substitute has dark face.
10BP4 10BP4A	10CP4	Change anode connector to cavity type. Remove ion trap.
	10EP4	Change anode connector to cavity type.
	10FP4A 10FP4	Remove ion trap.
10CP4	10BP4 10BP4A	Only where 1" greater length is available. Change anode connector to ball type.
	10EP4	Only where 1" greater length is available. Change anode connector from ball to cavity type. Remove ion trap.
	10FP4 10FP4A	Change anode connector to cavity type.
10EP4	10BP4 10BP4A	Change anode connector from ball to cavity type.
	10CP4	Remove ion trap.
	10FP4 10FP4A	Change anode connector from ball to cavity type. Remove ion trap.
10FP4	10FP4A	No changes.
10FP4 10FP4A	10BP4 10BP4A	Install double ion trap.
	10CP4	Change anode connector to ball type.
	10EP4	Change anode connector from cavity to ball type. Install double ion trap.
10MP4	10MP4A	No changes.
10MP4A	10MP4	No changes.

CUMULATIVE INDEX

The following index contains all the tubes listed in the RECEIVING TUBE SUBSTITUTION GUIDEBOOK, including those given in the First and Second Supplements, for which substitutions are given. Where (0) precedes the page number, the substitution information is given on the page referred to in the original RECEIVING TUBE SUBSTITUTION GUIDEBOOK; where (1) precedes the page number, the substitution information is given on the page referred to in the First Supplement; and where (2) precedes the page number, the substitution information is given on the page referred to in the Second Supplement.
